ML/CS PhD: research engineer/scientist building AI safety research automation.
Technical Background: AI-enabled full-stack engineering, research automation, research and product ownership.
Research Background: Interpretability by Design, Statistical Machine Learning, Optimal Transport, Differential Geometry, Convex and Nonconvex Optimization.
Working Toward: Proofs of AI safety, technical and non-technical AI governance.

Experience.

Forethought Research, AI Uplift and Automation Consultant *Apr 2026 - Oct 2026*

- Solo engineer for Forethought's internal uplift and automation tooling, owning the full stack: product design, TypeScript/Python services and frontends, GCP IaC, CI/CD; built with AI-first development and integration.
- Built a collaborative research-writing platform with Claude as a first-class editor.
- Shipped an internal Google Docs add-on for AI review "hats" to the Google Workspace Marketplace.
- Built an org-wide search index over Drive, Slack, Notion, and meeting transcripts, exposed via MCP.

Coordinal Research (coordinal.org), Founder *Jan 2025 - Mar 2026*

- Architected production AI safety research automation framework: multi-agent orchestration with hierarchical delegation, three-tier real-time validation (local checks, policy engines, AI-judge code review), and time-travel debugging via immutable workspace snapshots.
- Built eval infrastructure on Inspect integrating SWE-bench and RE-Bench with configurable agent scaffolding; deployed via warm AWS EC2 instance pools, Batch and Pulumi IaC for rapid benchmark iteration.
- Hill-climbed the scaffold on RE-Bench, raising full-suite average normalized score from 0.55 to 1.62 over a month of runs, with 6/7 tasks verified free of technical issues and reward hacking.
- Developed Python tooling for agent orchestration, telemetry (OpenTelemetry/Logfire), and CI/CD across specialized Docker and job requirements (GPU software stacks, LaTeX, Lean4 automated theorem proving)
- Raised $125K seed (SAFE); ran workshops for MATS scholars; managed incubator/accelerator programs (Catalyze Impact, 50/50), incorporation, legal, and cloud operations.

MATS, Research Scholar, cohorts 6.0 and 6.1 *Jun 2024 - Dec 2024*

- Worked on theoretical and practical methods for identifying and bounding worst-case model behavior. Fine-tuned efficient performance bounds from model internals, and applied Lipschitz optimization and mirror descent approaches for jailbreaking and outlier regions of the input sequence space.

Orca DB, Inc., Member of Technical Staff *Sep 2023 - Sep 2024*

- Founding scientist and engineer building out core ML business solutions and models enabling direct control and interpretability via memory inspection and editing.
- Worked on memory augmentation in PyTorch for machine learning models ranging from large language models to simpler classifiers and regression models for non-generative use cases.

Selected Independent Writing.

Coordinal: A Postmortem. ronakrm.com · Substack *2026*
Interpretable by Design: Constraint Sets with Disjoint Limit Points. ronakrm.com · LessWrong *2025*
Interpretability As A Science. ronakrm.com *2024*

Education.

PhD, Computer Sciences, Minor in Statistics, University of Wisconsin-Madison *2016 - 2022*
Thesis: Identifying Feature, Parameter, and Sample Subsets in Machine Learning and Image Analysis
Selected Publications: ICLR 2023 (top 25%), CVPR 2022, ICCV 2019 (x3), UAI 2019, 2021 (see Google Scholar)
MS, Computer Sciences, University of Wisconsin-Madison *2014 - 2016*
BSE, Computer Engineering, University of Michigan-Ann Arbor *2010 - 2014*
